

Sprint 1 Burndown Chart

Sprint 2 Burndown Chart

In sprint 2, our curve dropped steeply towards the end of the sprint. This is due to the dependencies between classes and the development of the front-end also depended on the back-end. Even though we aimed to complete as many subtasks as we can before we put together the code, there were still quite a bit of errors when we finally put together everyone's code.

The velocity is slightly higher in sprint 2 because we have slightly better clues about web development, even though we were still having trouble with HTTP requests and backend setup, most of the things are still new to us.
