

In sprint 4, our curve didn't drop like a right angle towards the end, but the drops were closer to the last couple of days. This is mostly because our group members have a small number of tasks, so most of us just finished our task towards the end. Aside from that, we all had other assignments around the weeks, so we couldn't really finish that early.

The velocity for sprint 4 is slightly faster than sprint 3 because this is our last sprint, so we had a little bit more to do than sprint 3. It is mostly just one major feature that needed our implementation, we all have to experiment with different code features in this sprint as well, for example, to structure the pages.
